

## Asset Capture and Inventory for Frontline Work

**Update your asset inventory directly from the field.**

Increase productivity, Improve Reliability, Reduce Travel

Enterprise equipment such as utilities installations require maintenance visits, upgrades and replacement.

WizyVision enables one-tap update of inventory to create an instantly updated, geolocated and reliable listing of equipment. As easy as taking a picture.

### Challenge

Organisations with extensive physical assets need to have a clear view of equipment status, maintenance and characteristics.

Existing solutions often require maintenance teams to fill forms to update their local asset inventory, which is tedious and time-consuming work.

Remote teams often need to have a view on the equipment and plan additional visits to actually see what's on the field.

### Solution

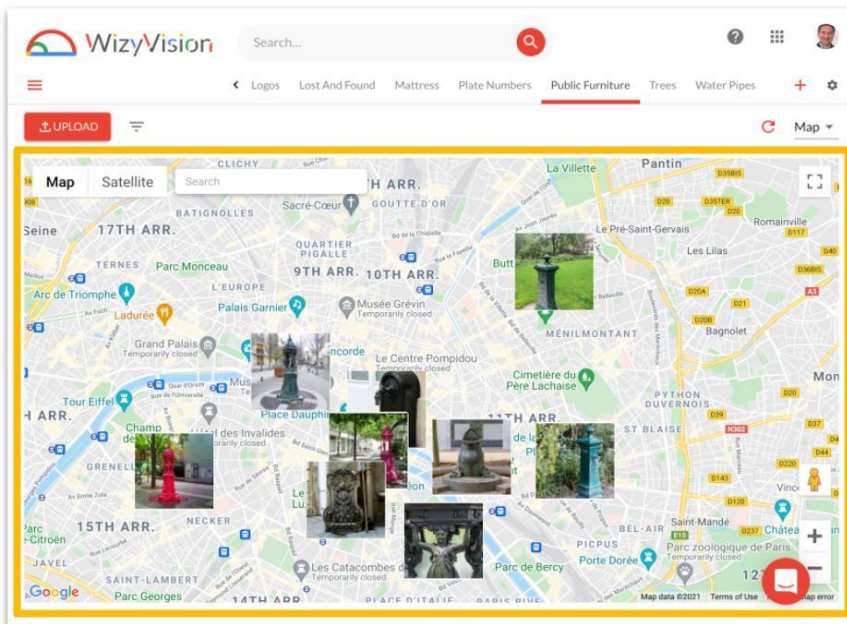

Instantly update your asset inventory from the field with WizyVision, simply by taking pictures from our mobile application.

- Capture asset data with pictures, without keying in information (type, ID, location...)
- Track jobs done with a photo-based inventory update real time on site
- Keep a visual history of assets by location.

All data can be easily exported through API to any business application (CMMS, CRM, ERP, Asset management...)

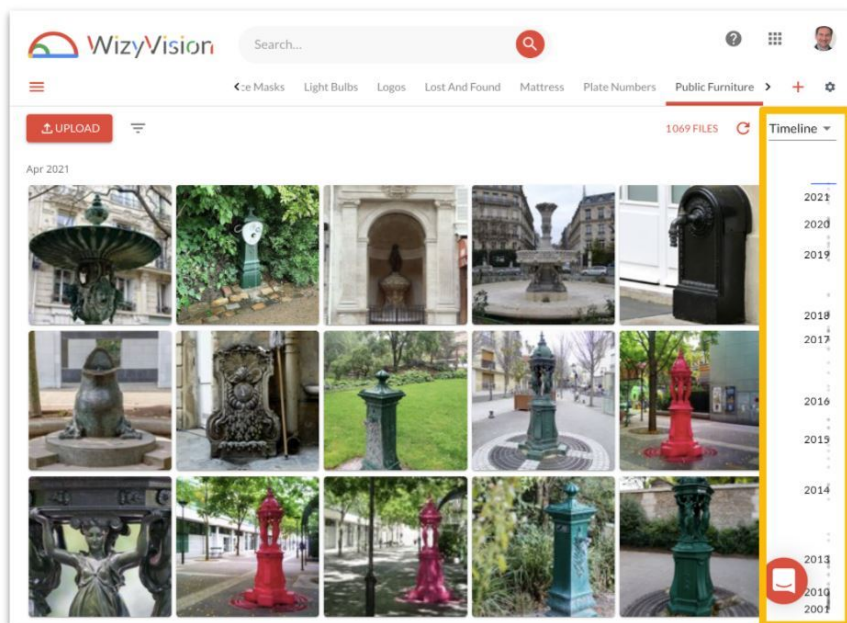

# Asset Capture and Inventory for Frontline Work

Upgrade your existing customer mobile applications with a smart image layer by integrating the WizyVision APIs.

## Search by location

Easily find your physical assets by location search, to view the digital history of each asset.

## View the asset history

View the digital history of your assets, to track their aging and follow up with the maintenance needs.
